

Basic Abdominal Ultrasound Techniques for the small animal practitioner - A 3 hour practical course

Prof Johan P Schoeman

BVSc, MMedVet(Pret), PhD(Cantab), DSAM, Dipl. ECVIM-CA

Course description for CPD purposes

Mastering the basic abdominal ultrasound examination is an essential skill for the small animal practitioner. The following topics and principles will be covered during an hour-long demonstration on a live dog. This will be followed by a 2-hour session during which the learning will be re-enforced, with all participants practicing the demonstrated techniques and watching colleagues practice the techniques.

1. Basic ultrasound principles and artefacts

- Velocity, Acoustic impedance, absorption, scatter, and reflection
- Attenuation
- Basic artefacts
 - Edge shadowing
 - Acoustic enhancement
 - Mirror artefacts
 - Reverberation
 - Comet tail or ring-down artefacts
 - Ultrasound lung rockets or B-lines
 - Side-lobe artefact
 - Slice thickness artefact
- Basic image orientation
- Probe selection
- Optimization of images
 - Depth
 - Gain
 - Frequency
 - Focal position and number

2. The basic abdominal ultrasound examination

- Patient positioning and probe orientation, movements, and angles
- Liver and gallbladder:
 - Sagittal and transverse section, hepatic veins vs. portal veins, liver echogenicity, gall bladder contents, liver lesions
- Falciform Fat
- Spleen:
 - echogenicity, size, contour
- Kidneys:
 - echogenicity, size, contour, criteria for pyelectasia, corticomedullary distinction
- Urogenital system:
 - Bladder wall thickness, content, trigone region, uterus/prostate

- Gastrointestinal system: Recognizing normal wall layering, GIT peristalsis, corrugation, atony, and gut wall thickness measurements:
 - stomach, rugal folds, fundus and pyloric regions
 - duodenum,
 - jejunum,
 - colon; ascending transverse and descending colon

The pancreas, adrenal glands, kidney resistivity index assessment through Doppler, the different vessels branching off the aorta, hepatic shunts, abdominal and mesenteric lymph nodes etc. are not covered in the basic abdominal ultrasound course, but rather in an advanced course once the basic techniques have been mastered.
